Abstract - The binary quadratic equation represented by the negative pellian $y^{2}=7 x^{2}-12$ is analyzed for its distinct integer solutions. A few interesting relations among the solutions are given. Further, employing the solutions of the above hyperbola, we have obtained solutions of other choices of hyperbolas, parabolas and special Pythagorean triangle.

## 1. INTRODUCTION

Diophantine equation of the form $y^{2}=D x^{2}+1$, where D is a given positive square-free integer is known as Pell equation and is one of the oldest Diophantine equation that has interesting mathematicians all over the world, since antiquity, J.L. Lagrange proved that the positive Pell equation $y^{2}=D x^{2}+1$ has infinitely many distinct integer solutions whereas the negative Pell equation $y^{2}=D x^{2}-1$ does not always have a solution. In [1] an elementary proof of a criterium for the solvability of the Pell equation $x^{2}-D y^{2}=-1$ where D is any positive non-square integer has been presented. For examples the equations $y^{2}=3 x^{2}-1, y^{2}=7 x^{2}-4$ have no integer solutions whereas $y^{2}=65 x^{2}-1, y^{2}=202 x^{2}-1$ have integer solutions. In this context, one may refer [2-17]. More specifically, one may refer "The on-line Encyclopedia of integersequences" (A031396, A130226, A031398) for values of D for which the negative Pell equation $y^{2}=D x^{2}-1$ is solvable or not. In this communication, the negative Pell equation given by $y^{2}=7 x^{2}-12$ is considered and infinitely many integer solutions are obtained. A few interesting relations among the solutions are presented.

## 2. METHOD OF ANALYSIS

The negative Pell equation representing hyperbola under consideration is
$y^{2}=7 x^{2}-12$
Whose smallest positive integer solution $x_{0}=2, y_{0}=4$
To obtain the other solutions of (1), consider the Pell equation $y^{2}=7 x^{2}+1$ whose solution is given by
$\tilde{y}_{n}=\frac{1}{2} f_{n}, \tilde{x}_{n}=\frac{1}{2 \sqrt{7}} g_{n}$
Where,
$f_{n}=(8+3 \sqrt{7})^{n+1}+(8-3 \sqrt{7})^{n+1}$
$g_{n}=(8+3 \sqrt{7})^{n+1}-(8-3 \sqrt{7})^{n+1}$
Applying Brahamagupta Lemma between $\left(x_{0}, y_{0}\right)$ and $\left(\tilde{x}_{n}, \tilde{y}_{n}\right)$, the other integer solutions of (1) are given by

$$
\begin{aligned}
& \sqrt{7} x_{n+1}=\sqrt{7} f_{n}+2 g_{n} \\
& y_{n+1}=2 f_{n}+\sqrt{7} g_{n}
\end{aligned}
$$

The recurrence relations satisfied by the solutions $x \& y$ are given by

$$
\begin{aligned}
& x_{n+3}-16 x_{n+2}+x_{n+1}=0, \\
& y_{n+3}-16 y_{n+2}+y_{n+1}=0, n=0,1,2,3 \ldots .
\end{aligned}
$$

Some numerical examples of $x \& y$ satisfying (1) are given in the Table 1 below

Table 1: Examples

| $n$ | $x_{n}$ | $y_{n}$ |
| :---: | :---: | :---: |
| 0 | 2 | 4 |
| 1 | 28 | 74 |
| 2 | 446 | 1180 |
| 3 | 7108 | 18806 |
| 4 | 113282 | 299716 |

From the above table, we observe some interesting relations among the solutions which are presented below

Then the following interesting relations are observed:

## 4. CONCLUSION

In this paper, we have presented infinitely many integer solutions for the hyperbola represented by the negative Pell equation $y^{2}=7 x^{2}-12$. As the binary quadratic Diophantine equations are rich in variety, one may search for the other choices of negative Pell equations and determine their integer solutions along with suitable properties.
